

Git and GitHub Guide

Krrish Dheeraj Jambhulkar

Step 1: Create RStudio Project and example.qmd

I created a new RStudio Project called `git-guide` to serve as the working directory for this assignment. Inside the project, I created a Quarto file called `example.qmd` with the following structure:

A YAML header specifying the title, author, and HTML output format
An Introduction section with a brief description
A simple R code chunk computing $1 + 1$

The file was rendered to HTML using the Render button in RStudio, confirming that the document knits successfully. The screenshot below shows both the source code and the rendered output side by side.

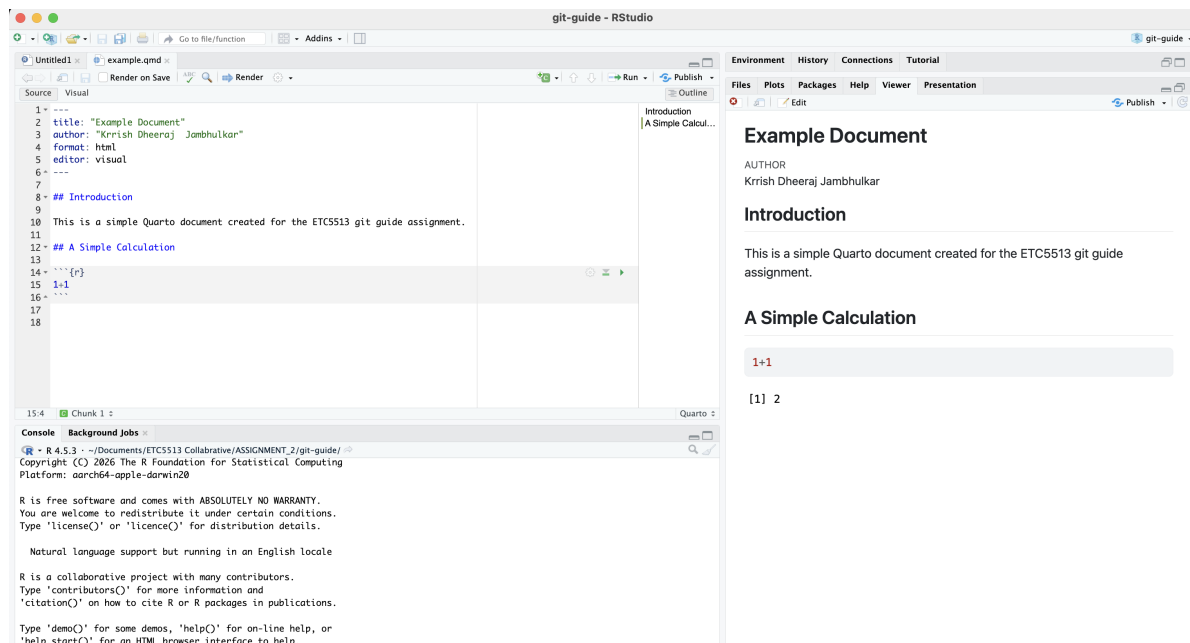

Figure 1: RStudio showing example.qmd and the rendered HTML output
